

JOHN AUSTIN Ltd

DRILLING - CROP SOWING & PASTURE RENOVATION

Depth control and seed placement is equally important whether planting or drilling. Our range of seed drills enables us to accurately drill all agricultural crops in seedbeds ranging from fully cultivated to no-till environments.

John Deere 750A Seed Drills

These drills are world renowned for providing unsurpassed seed placement and depth control. The superior coulter design enables these drills perform exceptionally well in all seed beds from cultivated soil to maize grain stubble. The seed metering and air delivery system accurately places small seeds such as Lucerne and brassicas and large seeds including maize for green feed. Three, four and six metre sowing widths available. The three metre 750A Drill is equipped with fertiliser delivery. We also have a three metre roller which can be towed behind the three metre drill for extra consolidation and seed to soil contact. Coulters are set at 155mm (6") row spacing. All our John Deere drills are equipped with green star auto track guidance sensors and John Deere seed sensors.

Amazone Cirrus - 6 metre

The Cirrus Super seed drill is designed for higher acreage outputs. The combination disc cultivator drill is highly effective when drilling into trashy conditions; leveling and consolidating the seed bed with a set of rollers prior to placing the seed. This drill is also suitable for preparing the seed bed and drilling in one pass behind a plough or simba solo disc ripper, making it cost effective. The Amazone Cirrus is ideal for sowing grass after brassica or maize crops. This drill has 100mm (4") row spacing. Amazone's own Amatron controller monitors the seed and seed calibration. John Deere auto trac and coverage maps are also used to ensure a perfect job every time.

Gespardo Gigante Direct Drill

This four metre drill is well suited to direct drilling of brassica, chicory and grass crops as well as green feed maize. The Gaspardo's unique dosing roller and metering system makes this drill very accurate when drilling small seeds like turnips and chicory. The genius in cab monitor makes changes on the go a breeze, enabling the operator to adjust seed and fertilizer rates from inside the cab. Fertilizer can also be placed with the seed at variable rates, from 50kg ha right up to 350kg ha. A specialized slug bait spreader is also fitted to this drill for slug bait placement in direct drilling applications. Coulters are set at 155mm (6") row spacing. John Deere auto trac and coverage maps are also used to ensure a perfect job every time.

Amazone RPD Powerharrow Drill

This three-metre combination powerharrow and drill provides a one pass minimum tillage and drilling option. This drill is well suited to brassica crop establishment as well as drilling perennial or annual pasture following crops. We also have a deep ripper attachment for this drill for loosening hard ground.

3M Vee Ring Roller Drill

For conventional roller drilling complete with a second roller to ensure good seed to soil contact. Leveling boards can also be used to level and firm the seed bed.

He-Va 6m Disc Roller with Air Multi-Seeder

This drill is well suited to roll seed roll applications where good consolidation of the seed bed is required. Also suited to drilling seed into cultivated ground. This drill is great for brassicas or pasture establishment. John Deere auto trac and coverage maps are used to ensure a perfect job every time.

Veredo 3" Seed Drill

For direct drilling grass to grass, the Veredo drill provides dense standards of permanent pasture when the seed can be drilled into an existing sward of pasture. For best results the veredo drill should be used in trash-free conditions.
